

CTN-115BJX

VERY HIGH POWER PORTABLE VHF/UHF JAMMER

(66-88 MHz & 130-180 MHz & 380-530 MHz)

Cellular telephones can be programmed to activate bombs. However, there is also the strong risk of other radio frequencies being used to remotely detonate planted bombs. It is now quite common practice for terrorists to use very simple and common RF controlled devices. For example, remote controls for toy cars, boats & airplanes, car alarms & garage doors, handmade radio emitters, and especially walky-talky mobile devices.

The CTN-115BJX is a special jammer designed specifically for the purpose of paralyzing and immobilizing several VHF/UHF, mostly used wireless communication frequency bands within a large predetermined area. The jammer operates from external DC power source (a vehicle's electricity or backup batteries), as well as from AC main power.

- Special police (S.W.A.T.)
- Bomb disposal squads
- Military security forces
- Riot and crowd control
- VIP protection
- Military convoys
- Border control units
